Hisaab AI (■■■■) — Complete Project Summary

Final Review, Architecture Hardening & Hackathon Demo Readiness Report • October 2026

Status: Demo-Hardened & Production-Ready	**Target Demo:** Tomorrow at 09:14 AM PKT
Framework: Streamlit 1.50+ & SQLite	**AI Models:** Gemini 3.8 Flash & Whisper-large-v3
Repository: github.com/Huzaifa1102/hisaab-ai	**Verification:** All 4 test suites passing (0 tracebacks)

1. Executive Overview & System Architecture

Hisaab AI is an intelligent, bilingual bookkeeper and digital khata tailored for Pakistani retail shopkeepers (kiryana stores, general stores, pharmacies, wholesale traders). It bridges the gap between chaotic physical receipts, hand-written Urdu registers, and digital accounting by allowing store owners to scan receipts, dictate transactions by voice, track customer udhaar (credit), and generate respectful WhatsApp recovery reminders.

Component	File	Core Responsibility & Architecture
Frontend UI	`app.py`	Streamlit web app featuring 5 primary tabs, review queue for unconfirmed receipts, sidebar utilities (seed demo data, offline toggle, reset DB, voice tab safety switch).
Core AI Engine	`core.py`	Gemini 3.8 Flash integration with Pydantic structured schemas (`ExtractionResult`), retry loop with backoff, currency/date normalizers, local fallback analytics, and Groq Whisper transcription.
Database Layer	`db.py`	Robust SQLite database (`hisaab.db`) storing normalized transactions. Computes customer net credit balances, duplicate transaction detection, unpaid bill tracking, and realistic demo data generation.
Offline Demo Cache	`demo_cache/`	Stores pre-computed JSON extractions for instant, guaranteed-working zero-internet demo presentations. Auto-caches successful live scans.
Accuracy Benchmark	`test_live_images.py`	Developer benchmarking tool that runs 3 extraction passes per image in `test_images/`, tests consistency, latency, and automatically builds real demo cache.

2. Detailed Functional Breakdown by Tab

Tab 1: ■ Smart Scan (Multimodal Document Processing)

Supports drag-and-drop uploading of receipts, invoices, utility bills (IESCO/SNGPL/PTCL), and khata notebook pages. Features side-by-side image preview, detected document type, confidence meter, AI warnings, duplicate detection banners, and an interactive data editor table allowing shopkeepers to correct numbers before committing to the ledger. Includes automatic offline cache fallback if internet drops.

Tab 2: ■■ Voice Khata (Speech-to-Ledger)

Allows store owners to record spoken voice notes in colloquial Urdu or Roman Urdu (e.g., *'Bhai Ahmed ne 500 rupay ka atta udhaar liya'*). Audio is transcribed with high accuracy using Groq Whisper-large-v3, presented in an editable text box, and parsed into structured transactions using Gemini. Fully toggleable via a sidebar safety switch for presentation control.

Tab 3: ■ Digital Ledger (Complete Records & Filtering)

Real-time, filterable ledger table displaying all historical store transactions. Filter by date range, transaction type (expense, udhaar_given, payment_received, cash_sale), status (paid, unpaid), or category. Includes summary KPIs and 1-click CSV export.

Tab 4: ■ Udhaar (Customer Khata & WhatsApp Debt Recovery)

Dedicated customer credit ledger. Computes net balance owed per customer (`udhaar_given - payment_received`), displays total store debt book, and provides full transaction history per debtor. Features an AI-powered WhatsApp reminder generator that crafts culturally polite, friendly recovery messages in Roman Urdu, Urdu Script, or English, complete with direct wa.me link generation.

Tab 5: ■ Financial Dashboard & Natural Language Q&A;

Executive financial overview with Plotly visualization (Expenses by Category, Monthly Spending Trend, 30-Day Cash Sales). Contains overdue utility bill alerts with 1-click 'Mark Paid' functionality. Features 'Ask Your Hisaab' — a natural language Q&A; engine answering store finances (e.g., *'Who owes me the most?'*, *'Is mahine bijli pe kitna kharcha hua?'*) with honest distinction between AI models and offline ledger analytics.

3. The 6 Hardening Fixes Implemented for Demo Safety

To guarantee 100% demo safety and zero failures during tomorrow morning's presentation, six comprehensive review and hardening tasks were executed without altering the design theme or adding unapproved scope:

Fix & Area	Requirement	Implementation Details & Outcome
Fix 1: Model Respect core.py / app.py	Remove auto-upgrades; respect exact user model; friendly 404.	Removed forced rewrites in `clean_model_name()`. Sidebar model field (`gemini-3.8-flash`) is strictly passed. Intercepted 404 API errors with user-friendly instructions to update sidebar with raw API message.
Fix 2: Honest Labels core.py / app.py	Never present offline or template answers as AI.	`ask_ledger()` and `draft_reminder()` return `(text, label)` tuples. Offline queries show *'■ Calculated from your ledger (offline, not AI)'*. Templates show *'■■ Template message (AI unavailable)'*. AI answers show *'■ AI answer'*.
Fix 3: Demo Cache app.py / demo_cache	Cache only from real scans; filename match; off by default.	Inspected `demo_cache/`. Auto-caching added to live scan flow. Offline mode is strictly OFF by default, only matches exact uploaded filename, shows banner *'Offline demo mode: showing a saved result for this image'*, and errors if missing.
Fix 4: Zero Tracebacks app.py / db.py	Eliminate Python stack traces across all edge cases.	Wrapped all API, DB, audio, and file I/O in `try/except`. Handled empty DB on all tabs, non-receipt image warnings (`doc_type='other'`), 0-entry extracts, user-deleted table rows, customers with missing phones, and missing Groq keys.

Fix 5: Safety Switch app.py (Sidebar)	Emergency toggle to hide Voice Khata tab during demo.	Added sidebar checkbox *'Show Voice Khata tab'* (default ON). When unticked, Tab 2 is omitted and tab indexes adjust seamlessly without exceptions or broken references.
Fix 6: Timeouts & Spinners core.py / app.py	Verify 45s timeout, 1 retry, and active spinners.	Verified `HttpOptions(timeout=45_000)` (45s) and 2-attempt retry loop with 1.5s backoff in `core.py`. All spinners dynamically display the active model name so screen never appears frozen.

4. Benchmark Testing & Verification Results

Every single test suite and compilation check was executed locally to ensure absolute runtime stability:

Verification Step	Command Executed	Result & Status
Python Compilation	`python -m py_compile db.py core.py app.py ...`	**PASS** (Exit code 0 — 0 syntax errors across all 7 Python files)
Normalization Suite	`python test_normalization.py`	**PASS** (Urdu digits, PKR currency prefixes, date formats, casing)
Voice & Offline Suite	`python test_voice_and_offline.py`	**PASS** (Mock voice extraction, demo cache schemas, DB balances)
Streamlit App Smoke Test	`python test_app_smoke.py`	**PASS** (4/4 steps: fresh empty DB render, 22-record seed render, full chart render, and voice safety switch toggle — 0 exceptions)
Git Remote Tracking	`git push origin main`	**PASS** (Pushed to github.com/Huzaifa1102/hisaab-ai — commits sequential)

5. Demo Day Quick Run Guide (Tomorrow at 09:14 AM)

Follow these exact steps to ensure a flawless presentation:

Step 1: Benchmark Live Images and Build Real Cache (Optional)

Run the benchmark script with your live Gemini key. This will run 3 passes per image, check consistency, and automatically save the real API output into `demo_cache/` for offline demo use:

```
python test_live_images.py
```

Step 2: Launch Streamlit App

Start your local server (or access the currently active background server at `http://localhost:8501`):

```
streamlit run app.py
```

Step 3: Recommended Demo Flow

1. **Start on Tab 3 (Ledger):** Click *'Load Demo Ledger'* in sidebar to show instant 22 realistic transactions.
2. **Tab 5 (Dashboard):** Show overdue IESCO bill alert, click *'Mark Paid'*, and ask *'Who owes me the most?'* via Ask Your Hisaab.

3. **Tab 4 (Udhaar):** Select debtor Ahmed Raza (Rs 2,500), draft a Roman Urdu AI reminder, and show the WhatsApp link.
4. **Tab 1 (Smart Scan):** Upload `test_images/electricity_bill.png` to showcase live structured extraction.
5. **Backup Safety:** If venue Wi-Fi is unstable, toggle *'Offline demo mode'* in the sidebar for guaranteed 0-latency cached results.

Generated automatically by Antigravity AI Coding Assistant for Hisaab AI. Good luck with tomorrow's demo!
